                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a culture system for stable high-level production of recombinant plasmids. The method comprises propagating irreversibly altered bacterial cells under conditions such that cell viability is dependent on the recombinant plasmid. The system is used is for the replication and high-level production of structurally and genetically stable recombinant plasmids carrying DNA, this DNA can then be used in DNA immunisation or gene therapy. PCR primers AAX86098-99 were used to amplify the murF gene, for use in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Culture system for stable and high-level production of DNA contained on recombinant plasmids, with improved plasmid stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

                                                                                                                                                                                                                             temperature-sensitive murF gene (see also AAT6336) were used to amplify th temperature-sensitive murF gene (see also AAT6336) from Escherichia (coli TKL-68. The amplified nucleotide sequence was cloned into the BamHI site of pUC19, and can be used to produce temperature-sensitive bacterial host cells useful for large-scale prodn. of recombinant placemide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Culture system for stable and high-level production of DNA contained on recombinant plasmids, with improved plasmid stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a culture system for stable high-level production of recombinant plasmids. The method comprises propagating irreversibly altered bacterial cells under conditions such that cell
                                                                                                            Culture system for stable high yield production of recombinant plasmids . using bacteria with modified chromosome that can survive only when plasmid is present and optionally foreign DNA expressible only in eukaryote(s)
                                                                                                                                                                                                                                                                                                                                                                                                    Length 39;

The analogue is composed of human FVIII but carries the B-domain of human FV in place of the FVIII B-domain.

Oligonucleotides can be used to alter the profile of the blood factor without significantly altering its activity.

The invention relates to raising a neutralising antibody response to a broad spectrum of HIV (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or minics highly conserved portions of the goal envelope glycoprotein which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or minic the coiled coil solution structure of the N-helical domain (the heptad repeat region), or can correspond or minic the C-helical domain (the ransmembrane-proximal amphipathic alpha-helical segment), or the gp41 core 6-helix bundle, which is formed by the interaction of the N- and C-helical domains of three gp41 proteins. The peptides can be administered either singly or as a combination (particularly a combination of N-helical and C-helical peptides), and can be multimerised. For example, N- and C-helical domain peptides can be
                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure -

viability is dependent on the recombinant plasmid. The system is used is for the replication and high-level production of structurally and genetically stable recombinant plasmids carriying DNA, this DNA can then be used in DNA immunisation or gene therapy. PCR primers AAX86102-03 were used to amplify the murF gene, for use in the method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a muclootide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific
                                                                                  and isolates. The peptide compositions may be administered as a prophylactic or therapeutic vaccine to generate antibodies which reduce or inhibit the ability of HIV to infect uninfected cells. A composition comprising polyclonal or monoclonal antibodies can be administered to reduce HIV infection of uninfected cells. Antibodies can be administered to entry-relevant gpd1 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry. Sequences AAA72104-A72107 represent PCR primers used in an examplification of the invention to construct DNA (AAA72102) encoding a protein construct (AAB44603) comprising the N- and C-helical domains of HIV-1 gp41 separated by a short peptide linker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;
alternately linked together to form a peptide which mimics the core 6-helix bundle. Administration of the peptide(s) generates a humoral response, with the production of antibodies against gp41 structures involved in viral entry. As these portions of gp41 are well conserved, such antibodies may be effective against a broad range of HIV strains
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention includes antisense oligonucleotides AAF94680 - AAF94637 which target a RhoA nucleotide sequence, AAF94686 - AAF94684 which target a RhoC nucleotide sequence, AAF94769 - AAF94769 which target a Rac 1 nucleotide sequence and AAF94765 - AAF94809 which target a Rac 1 nucleotide sequence and AAF94765 - AAF94809 which target a Cdc42 nucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and ischaemia/reperfusion or recoxygenation injury. The compound may also be used to diagnose the above conditions.
             to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
antigen (PSA) dosage. However, the effectiveness of this is limited due
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rho; GTP binding protein; phosphorothioate antisense oligonucleotide; RhoA; RhoB; RhoC; Rac 1; cdc42; hyperproliferative condition; cancer; wound healing; clotting; ischaemia; reperfusion; reoxygenation;

```
The present sequence is the M34 primer involved in the second stage of pCR in the novel method for amplifying a target segment of nucleic acid in a sample nucleic acid mixture. It is part of the second stage primer mixture that is made up of 3 different primers: F2, R2, and M34 in relative molar ratios of 0.25: 0.125: 1. Using both first and second stage primers in the nested PCR method provides an enhanced system for specific, sensitive and rapid detection of the presence and identification of Mycoplasma species and Mycoplasma-like organism (MLO) contaminants contained in a sample of nucleic acid. The method allows detection of less than 200 colony forming units (cfu)/ml of Mycoplasma species M. Fermentans, M. hyorhinis, M. arginni, M. pirum, M. hominis and M. salivarium and 350 cfu/ml for M. orale. This compares to detection (levels of low of unike prior art Mycoplasma detection systems. Also, unlike prior art Mycoplasma detection systems. The new method and primers can detect the MLO contaminant Acholeplasma laidlawil at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Two-stage PCR system using sets of mixed and single sequence primers – useful for sensitive detection of mycobacteria and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mycobacteria-like organism contamination of nucleic acid samples

                                                                                                                                                                                                                                                                                                                                                                                         Sequence 9, Application US/08709915
Patent No. 5804417
GENERAL INFORMATION:
APPLICANT: Martens, Gerardus J. M.
APPLICANT: Chaudhuri, Bhabatosh
APPLICANT: Stephan, Christine
TITLE OF INVENTION: Production of Proteins Using 7B2 Protein
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
                                                              /function= "primer for PCR"
/product= "synthetic oligonucleotide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 29;

The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neutrophil activating protein; NAP; stomach; ulcer; cancer; neutrophil; activation; adhesion; inflammatory response; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides several probes and PCR primers which can be used in the detection of bacteria belonging to the genera of Microbispora, Microtetraspora, Nonmuria and Planobispora. The sequences hybridise to the 165 rRNA coding sequence of the organism. The present sequence is a PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid probe hybridizing to nucleic acid encoding portion of 16S rRNA of bacteria of genera Microbispora, Microtetraspora, Nonomuria and Planobispora, useful for detecting these bacteria in

The present invention describes Staphylococcus thioredoxin reductase (TrxB). The present sequence represent a PCR primer for S. aureus TrxB. TrxB inhibitors can be used as antimicrobials to treat a Staphylococcus, particularly S. aureus, infection. TrxB inhibitors are antimicrobials to which, unlike most of those in the prior art, Staphylococcus has not yet
                                                                                                                                                                                                                                                                                                                                                                       A new thioredoxin reductase from Staphylococcus aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-sense strand of the coding sequence of human 7B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7B2; chaperone function; deaggregation; PCR; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 13.8; DB 20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents NAP PCR primer #2, used with primer #1

(AAZ34654) to amplify DNA (AAZ34653) encoding the neutrophil activating
protein (NAP) from Helicobacter pylori strain CCUG. The PCR product
was then cloned into the Escherichia coli and Bacillus subtilis
was then cloned into the Escherichia coli and Bacillus subtilis
shuttle vector pSMZ14G for recombinant production. In humans
infected with H.pylori, NAP promotes activation and adhesion
of neutrophils to endothelial cells, an inflammatory response.
C. Since H. Pylori is responsible for stomach inflammation, it is possible
that NAP elicits the inflammatory response, probably at an early stage
of gastric uncer disease, when neutrophils accumulate in the superficial
castif mucosa. The invention relates to a novel process for enriching
the presence of Helicobacter pylori NAP in a mixture of proteins. This
comprises the steps of salting out other proteins (NAP being soluble at
comprises the steps of salting out other proteins (NAP being soluble at
comprises the steps of salting out other proteins (NAP being soluble at
contrastic mucosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (preferably with immobilised nickel cations). The NAP purified or enriched in this way is free from amino acid sequences or alterations introduced during cloining (e.g., polyhistidine tags, thioredoxin fusions or GST fusions). NAP produced via this process may be useful for the production of therapeutic agents, such as vaccines. It may also be useful in an immunoassay to ascertain antibody levels in a body sample,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enriching presence of Helicobacter pylori neutrophil activating protein, useful in diagnostic and therapeutic products and processes

                                                                                           The source of the DNA is partly human genomic DNA whilst the immediate experimental source is synthetic. AAQ42515 and AAQ42521 are used in the construction of a truncated 7B2 gene encoding an amino terminal 7B2 signal peptide and the first 170 AAs of the human protein. They are used as primers in a PCR using complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Non-covalent complex; antibody; immunoglobulin; immunogen; vaccine; cytotoxic; expression agent; treatment; cancer; expression; transgene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAV43257-58 represent primers used to amplify plasmid pK5DT. The specification describes a non-covalent complex that comprises at least one antibody, or its fragments, able to bind a cell surface molecule and a component that binds (to only 1 type of site) an immunoglobulin (Ig) or fragment, and is associated with an active substance. The complexes are used as immunogens, vaccines or as cytotoxic or expression agents, e.g. for treatment of cancer or
Efficient expression and de-aggregation of protein - by treating co-expressing protein, e.g. hormone, growth or coagulation factor or neuro-peptide with 7B2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         binding component - linked to active agent, e.g. antigen, drug or
nucleic acid, used for treatment of cancer
                                                                                                                                                                                                                                                                                       ö

A cell containing the construct is cultured under conditions permitting GFP expression, and its fluorescence measured. The cell is then incubated with the substance, and its fluorescence massured, where any change indicates that the substance is phologically active. The construct can also be used to generate probes for use in basic research, and screening programmes to
                                                                                                                                                                                                                                                                                                                                     Green fluorescent protein; detection; active substance; affecting;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         identify new biologically active substances. The use of fundinescent probes allows real time studies of 2nd messengers and specific enzymes, e.g. protein kinases, in single living cells, making possible the study of the precise timing and spatial characteristics of these factors. Due to the strong filucrescence of GFP, the luminescence of cells expressing the probes, which are easily introduced into cells, can be easily detected and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New construct encoding modified green fluorescent protein - conie.g. enzyme recognition site, useful for detecting biologically active substances affecting intracellular processes

3'PCR primer for isolation and characterisation of P. pastoris FLD1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Restriction enzyme recognition sites are introduced into the human serum albumin gene at one or more positions sites are pries preparation of fusion genes. The restriction sites are prefuncaduced at the N-terminus, he C-terminus, between the first and second domains and/or between the second and third domains of HSA. The modified HSA gene can then readily be fused to a sequence coding for a physiologically active peptide, e.g. a cancer metastasis inhibitor. The present sequence is that of a PCR primer which was used in the construction of coding sequences ANTI2919 and ANTI2920 which had restriction sites introduced into the gene at positions corresp to the region between domains 1 and 2 or between domains 2
                                                                                                                                                                                                                                                                                                                                                                      Human serum albumin gene modified by introduction of restriction site – useful for production of fusion proteins by inserting active peptide coding sequence into new restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Methylotrophic yeast; formaldehyde dehydrogenase 1; FLD1; marker; formaldehyde resistance; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT27602-T27615 are PCR primers used for the construction of vectors carrying human serum albumin (HSA) fusion proteins (FPS). The HSA FPS contain a peptide capable of inhibiting metastasis of cancerous cells. The primers are used to introduce restriction sites into the HSA gene for efficient expression and recovery of the FP. Introduction of the anti-metastatic peptide does not destroy the stereo structure of HSA. Previously such fusion proteins could only be produced by a combination of a chemical synthetic method and a binding method. Using recombinant DNA technology for FP prodn. provides a steady supply of the fusion protein on an industrial scale.

                                                                                                                                                                                                                                                                                                                                                             ;;
                                                                                                                              The present sequence is a 3' PCR primer used in RT-PCR to amplify intron corresponding region from total P. pastoris mRNA, for isolation and characterisation of formaldehyde dehydrogenase 1 (FLD1) gene. FLD protects cells from toxic effects of formaldehyde and imparts formaldehyde resistance. It is therefore useful as a selectable marker in methylotrophic yeast. Expression cassettes comprising FLD regulatory sequences (promoter and terminator) can be used to control the expression of heterologous proteins in transformed methylotrophic yeast cells. Formaldehyde resistant host cells can be selected by transforming them with a vector comprising FLD gene operably linked to a heterologous promoter and growing them in the presence of formaldehyde.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT00817 and AAT00818 are amplification primers for the stem, transmembrane and cytoplasmic domains of the 75 kD tumour necrosis factor

The amplified sequence is used in a chimeric protein with the erythropoletria receptor (EDOR) sequence amplified by AATOOB13 and AATOOB14.

AATOOB14. A vector that expresses a chimeric receptor, such as the one created using the amplified sequence, can be used for the treatment of created using the amplified sequence, can be used for the treatment of tumours, and to provide a model for studying the formation of tumours. By altering the extracellular and transmembrane domains of the chimeric protein, the target sequence is changed. The formation of multimeric receptor complexes on the extracellular surface, when the chimeric protein is used, is sufficient for transmitting a positive signal to the cytoplasmic domain of the receptor. This occurs even in the absence of the cognate ligand, or in the presence of a ligand that has entirely different activities. The advantage with using the chimeric protein is the response of the cytokine (in this case TNF) can be induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This oligonucleotide was used as a primer for the PCR amplification of a cDNA clone (see AAX25358) coding for the T cell receptor (TCR) beta chain (see AAX05728) from the Al CD4+ T cell clone isolated from CBA/Ca mice. The Al clone recognises the minor histocompatibility antigen H-Y present in male, but absent in female, mice. The amplified product was used in the construction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T cell receptor beta chain; mouse; transgenic animal; animal model; immunological tolerance; graft rejection; tissue grafting; neonatal intolerance; transplantation antigen; H-Y antigen; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                         Gaps
             animal model comprising TCR alpha and beta chains. It provides a genetically modified non-human mammal having a population of CD4 positive T cells specific for one or a limited number of selected antigens, including at least transplantation antigen capable of rejecting a tissue transplant containing the transplantation antigen and if applicable, the other selected antigens. The animal has TCR genes which encode a TCR specific for the transplantation antigen. The animal is useful for studying immunological tolerance, especially the mechanisms of tolerance to, and the rejection of, tissue grafts, and in pregnancy. The animals are also useful for testing agents for biological activity in
    The invention relates to a transgenic

cell under conditions that repress expression of (P) and then inducing its expression which, if is inhibitory to host cell growth, is indicative of BP expression. An antimicrobial peptide from the present invention, which is stabilised, is used for treating a patient having a condition treatable with a peptide drug. The stabilised peptides are also used for inhibiting the growth of a microbe. The new antibacterial peptides are useful to treat various pathogenic bacteria such as staphylococci, Streptococci and Enterococci which are the primary causes of nosocomial infections. Over inhibitor peptides identified by the method can be medical treatments and therapies directed against microbial infection. Also, these novel inhibitor peptides can be used, in turn, to identify additional novel antibacterial peptides using a synthetic approach, and can also be used to elucidate potential new drug targets. The inhibitor peptide target which is inactivated is identified using reverse genetics by isolating mutants that are no longer inhibited
                                                                                                                                                                                                                                                                                       by the peptide. These mutants are then mapped in order to precisely determine the protein target that is inhibited. AAA56033 to AAA56106 and AAY90964 to AAY90999 are sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of new human kernon acceptor co-repressor coding series and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 41, Assequence 4, Assequence 4, Assequence 4, Assequence 4, Assequence 4, Assequence 30, Assequence 30

                   The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                   in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                Gaps

MASC1 protein. The PCR templates were derived from tumour cell lines, and the amplicons were tested for mutations. The MMSC1 protein is a cand the amplicons were tested for mutations. The MMSC1 protein is a ward interacting protein which is involved in tumour suppression activity in the MMAC1 pathway. MMSC1, antigenic fragments or fusion continuity in the MMAC1 pathway. MMSC1, antigenic fragments or fusion continuity in the MMAC1 genemates for antibody production. Primers derived from MMSC1 gene used as immunogens for antibody production of MMSC1 can be used for identification of MMSC1 gene an alteration in am MMSC1 gene is indicative of a predisposition to cancer. A seminine cancer. A somatic mutation in an MMSC1 gene is indicative of a predisposition to cancer. A somatic mutation in an MMSC1 gene is indicative that the tissue is cancerous. Analysis of MMAC1 and MMSC1 or predisposition to cancer. Sometic mutations can be used for detection of alterations in MMAC1 cancer. Wild-type MMSC1 or a homologue can be used to supply wild-type MMSC1 gene function (or a substantially similar concertion) to a cell, which has lost the gene function due to a MMSC1 gene mutation. The gene suppresses neoplastic growth of the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences AAA14008-A14047 represent phosphorothioate antisense oligonucleotides targetted to the human liver glycogen phosphorylase coligonucleotides targetted to the human liver glycogen phosphorylase sequence of interpression. The antisense coligonucleotides were designed to target different regions of human liver glycogen phosphorylase RNA, and were analysed for their effect on liver glycogen phosphorylase is one of three glycogen phosphorylase is encoded by three different genes. Liver glycogen phosphorylase is encoded by the PYGL gene, which is located on chromosome 14. Liver glycogen phosphorylase (also known as 1,4-alpha-D-glucan:orthophosphate cappropriate glycogen phosphorylase (also known as 1,4-alpha-D-glucan:orthophosphate cappropriate in the liver to glucose-1-phosphate via the cleavage of the alpha-1,4-glycosidic bonds. It therefore plays a critical role in carbohydrate metabolism and blood glucose homeostasis. Inhibition of liver glycogen phosphorylase and chere's in diabetic patients, particularly those with type II (non insulin-dependent) diabetes. The antisense olygonicototides collonuctootides of the invention are useful for diagnosis, prevention and treatment of conditions associated with liver glycogen phosphorylase expression, or those which may benefit from inhibition of liver glycogen phosphorylase
                                                                                                                                   1,4-alpha-D'glucan:orthophosphate alpha-D-glucosyltransferase; HGLP:
glycogenolysis, carbohydrate metabolism; blood glucose homeostasis;
expression inhibition; hypoglycaemic; type II diabetes;
non insulin-dependent; antisense; phosphorothioate; ss.

                                                                                                                                                                                                              This DNA sequence is a region of a Zea mays genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation. e.g. to determine common or disparate ancestry between 2 or more plants, i.g. monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant to to defentify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
The present invention describes a nucleic acid segment comprising at least 10 contiguous nucleotides from a vegetal sequence including a polymorphic site which is a single nucleotide polymorphism (SNP), or the complement of the segment. Also described are: (1) an allele-specific oligonucleotides hybridising to segment, or their complements, and (2) a method of analysing nucleic acids from a subject, by determining if a base is occupying any one (or a set) of polymorphic sites in 261 sequences derived from six maize lines (see AAW47701 to AAW47961). The segments are useful in fingerprint analysis in plants to determine which polymorphisms are present, which strain a plant belongs to and to distinguish between strains. The polymorphisms may correlate with phenotypic traits (e.g. plant growth rate or crop yield), and the segments are useful to determine the presence/absence of specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymorphisms correlating with the existence/absence of particular traits. The segments are also useful in marker assisted back-cross techniques to select plants with a higher percentage of recurrent parent in a back-cross population. Segments incorporate SNRs which occur more frequently than other polymorphism types and are therefore more likely to be located close to genetic loci of interest; different forms of characterised SNRs are also often easier to detect than other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This DNA sequence is a region of a Zea mays genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This DNA sequence is a region of a Zea mays genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation. e.g. to determine common or disparate ancestry between 2 or more plants, to contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                                                                                          Brassica species allele-specific oligonucleotide probes and primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic marker; allele-specific; primer; probe; amplification; hybridisation; plant; hybrid certification; genetic contribution; progeny; back-cross; hybrid; ancestry; maize; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                            The present invention describes a nucleic acid segment comprising at least 10 contiguous nucleotides from a vegetal sequence including a least 10 contiguous nucleotides from a vegetal sequence including a polymorphic site which is a single nucleotide polymorphism (SNP), or the complement of the segment. Also described are: (1) an allele-specific coligonucleotides hybridising to segment, or their complements, and (2) a method of analysing nucleic acids from a subject, by determining if a base is occupying any one (or a set) of polymorphic sites in 261 sequences derived from six maize lines (see AAV47701 to AAV47961). The segments are useful in fingerprint analysis in plants to determine which polymorphisms are present, which strain a plant belongs to and to distinguish between strains. The polymorphisms may correlate with penotypic traits (e.g. plant growth rate or crop yield), and the segments are useful to determine the presence/absence of specific polymorphisms correlating with the existence/absence of particular traits. The segments are also useful in marker assisted back-cross techniques to select plants with a higher percentage of recurrent parent in a back-cross population. Segments incorporate SNPs which occur more frequently than other polymorphism types and are therefore more likely to be located close to genetic loci of interest; different forms of characterised SNPs are also often easier to detect than other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                   Vegetal sequences including single nucleotide polymorphism - useful, e.g. to determine polymorphisms in plants, determine strain in plant breeding and to correlate polymorphisms with phenotypic traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymorphic marker; allele-specific; primer; probe; amplification; hybridisation; plant; hybrid certification; genetic contribution; progeny; back-cross; hybrid; ancestry; maize; ss.

                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a nucleic acid segment comprising at beast 10 contiguous nucleotides from a vegetal sequence including a polymorphic site which is a single nucleotide polymorphism (SNP), or the complement of the segment. Also described are: (1) an allele-specific oligonucleotides hybridising to segment, or their complements, and (2) a method of analyzing nucleic acids from a subject, by determining if a base is occupying any one (or a set) of polymorphic sites in 261 sequences derived from six maize lines (see AAV47701 to AAV47961). The
                                                                                                    This DNA sequence is a region of a Zea mays genome which contains a polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vegetal sequences including single nucleotide polymorphism - useful, e.g. to determine polymorphisms in plants, determine strain in plant breeding and to correlate polymorphisms with phenotypic traits

The present invention describes a nucleic acid segment comprising at least 10 contiguous nucleotides from a vegetal seguence including a polymorphic site which is a single nucleotide polymorphism (SNP), or the complement of the segment. Also described are: (1) an allele-specific oligonucleotides hybridising to segment, or their complements, and (2) a method of analysing nucleic acids from a subject, by determining if a base is occupying any one (or a set) of polymorphic sites in 261 sequences derived from six maize lines (see AAV47701 to AAV47961). The segments are useful in fingerprint analysis in plants to determine which polymorphisms are present, which strain a plant belongs to and to distinguish between strains. The polymorphisms may correlate with
are useful in fingerprint analysis in plants to determine which
                                                                                                                                                                                                                                                       techniques to select plants with a higher percentage of recurrent parent in a back-cross population. Segments incorporate SNPs which occur more frequently than other polymorphism types and are therefore more likely to be located close to genetic loci of interest; different forms of characterised SNPs are also often easier to detect than other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vegetal sequences including single nucleotide polymorphism - useful, e.g. to determine polymorphisms in plants, determine strain in plant breeding and to correlate polymorphisms with phenotypic traits
                          polymorphisms are present, which strain a plant belongs to and to distinguish between strains. The polymorphisms may correlate with phenotypic traits (e.g. plant growth rate or crop yield), and the segments are useful to determine the presence/absence of specific polymorphisms correlating with the existence/absence of particular traits. The segments are also useful in marker assisted back-cross
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize; marker; probe; PCR primer; polymorphism; vegetal sequence; polymorphic site; corn; graminae species; ss.

AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The
phenotypic traits (e.g. plant growth rate or crop yield), and the segments are useful to determine the presence/absence of specific polymorphisms correlating with the existence/absence of particular traits. The segments are also useful in marker assisted back-cross techniques to select plants with a higher percentage of recurrent parent in a back-cross population. Segments incorporate SNPs which occur more frequently than other polymorphism types and are therefore more likely to be located close to genetic loci of interest; different forms of characterised SNPs are also often easier to detect than other

construct a synthetic DNA plasmid sequence synlus4, to demonstrate the method of the invention. Within the synlus4 sequence are included the sequences of lux A, lux B, the A and B components of the Vibrio fisherii luciferase sequence, positions of pUC19 including the origin of replication and replication stability sequences, and the promoter and coding sequence for the Ranamycin/neomycin phosphotransferase. The specification describes a method for the synthesis of replication competent double-stranded polynucleotides. The method comprises generating a first set of oligonucleotides corresponding to the plus strand and a second set corresponding to the minus strand and a second set corresponding to the minus strand and a nocoding sequences involved in a biochemical pathway. In particular, they can be used to produce polynucleotides encoding enzymes, they can be used to produce polynucleotides encoding enzymes, they can be used to produce polynucleotides encoding enzymes, they can be used to produce polynucleotides encoding enzymes, and tolase, thiose-phosphate isomerase, phosphoglycerate mutase, phosphoglycerate mutase,
polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthesis of replication competent double-stranded polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA plasmid; lux A; lux B; Vibrio fisherii; luciferase; promoter; tn9 kanamycin/neomycin phosphotransferase; DNA synthesis; replication competent double-stranded polynucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This PCR primer was used in the amplification of 5-oxoprolinase cDNA (see also AAV28111-12) from rat kidney cDNA. The primer incorporates an Ndel site at the start codon of the 5-oxoprolinase. CDNA. The PCR product was used in the construction of expression plasmids for 5-oxoprolinase. Mammalian 5-oxoprolinase (m50P) catalyses the ATP dependent cleavage of 5-oxoproline to L-glutamate in the metabolism of glutathione. Deficiency of the enzyme is associated with 5-oxoprolinuria. The invention is directed toward isolated nucleic acid molecules encoding m50P. Expression vectors and host cells are provided, as well as methods of increasing (by gene therapy) or decreasing (e.g. using antisense or ribozyme molecules) the expression of m50P in host cells.
                                                                                                                                                                                                                                                                                                                                                                                                    5-oxoprolinase; rat; glutathione; 5-oxoprolinuria; gene therapy; diagnosis; PCR; primer; ss.

Sequence 17, Application US/09377310B

Sequence 17, Application US/09377310B

Patent No. 6133031

GENERAL INFORMATION:
APPLICANT: Monia, Brett P.
TITLE OF INVENTION: Antisense Modulation of Focal Adhesion Kinase
TITLE OF INVENTION: Expression
FILE REFERENCE: ISPH-0389
CURRENT APPLICATION NUMBER: US/09/377,310B
CURRENT FILING DATE: 1999-08-19
NUMBER OF SEQ ID NOS: 43
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 17
FERMAND: APPLICATION OF 12.0
   Sedinence Sedine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RELATING TO THE DNA BINDING PROTEINS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Suite 800

                         The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII k fragment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to a 3.6 kb HindIII to BajlII subfragment of the HindIII M cragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to determine whether the swine has been vaccinated with the accine, particularly containing S-SPV-008, or is infected with a naturally occurring wild-type pseudorables virus. Also (I) inserted into immunodeficiency virus (FIV) env and agg genes and Dirofilaria immitis psy and 22kd are useful to detect feline immunodeficiency caused by FIV and to detect heartworm caused by D. immitis respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mucociliary dysfunction is the inability of ciliated epithelium to clear mocus and sputum in lung airways. Mucociliary dysfunction is a serious complication of chronic obstructive lung diseases such as Chronic bronchitis (CB). Bronchiectasis (BE), asthma and Cystic Fibrosis (CF). In addition, patients suffering from mucociliary dysfunction are susceptible to secondary bacterial infections. A partial coding sequence for human placental bikuin has been isolated (see AAA70371). Placental bikuin is a Kunitz-type serine protease inhibitor protein, which can stimulate the rate of mucociliary clearance of mucus and sputum in lung airways. Therefore, placental bikuin protein may be used for treating ung diseases such as CF, CB, BE, and chronic sinusitis and glue ear which are caused by retention and accumulation of mucus. The present sequence is an oligonucleotide used to clone the partial human placental bikunin coding sequence of AAA70371.
                                                                                                                                                                       3' oligonucleotide # 1 used for cloning human placental bikunin cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Stimulating mucociliary clearance rate of mucus and sputum in lung airways for treating lung diseases such as cystic fibrosis and bronchitis involves administering a Kunitz-type serine protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eleven pairs of primers were synthesised and used to generate PCR products of around 280bp, that covered the complete katG gene and some of the flanking sequences. With these primers, a panel of INH-resistant strains of M tuberculosis was examined using PCR-SSCP analysis to localise the katG mutations responsible for isoniazid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rapid detection of antibiotic resistance in Mycobacteria - esp. 1soniazid, rifampicin or streptomycin resistance in tuberculosis by detecting mutation in katG, rpoB or rpsL genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazolifne, thiazolifne, bithiazoline and bithiazolime-containing microbial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention provides an erythromycin-producing organism that expresses a heterologous oxygen-binding protein. The oxygen-binding protein can be used in a method for increasing erythromycin production that comprises culture of oxygen-binding protein under erythromycin production that comprises saccharopolyspora erythraea with an exogenous DNA construct, comprising directing integration of the construct at the phi C31 attachment site of the S. erythraea chromosome. The organism and the methods are used to provide more efficient production of erythromycin. Sequences AAX05608-609 represent PCR primers used for the amplification of PmerR promoter. This is used in the construction of expression vectors containing Vitreoscilla haemoglobin (Vhb) and chromosomal integration of the Vhb expression cassette in S. erythraea.
frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory diseases such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinustis, purlent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3684-AX3679) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Erythromycin; oxygen-binding protein; transformation; S. erythraea;

                                                                                                                                                                                                                                                              AAQ88809 was used in combination with AAQ88810 as primers for the PCR amplification of BoPcaR I, bovine parathyroid calcium receptor, which was used to test the effectivess of new calci-mimetics that mimics the action of extracellular ca ions. These calci-mimetics can be used in the treatment of a variety of diseases associated with abnormal levels of ca in cells, blood and plasma, specifically hyperparathyroidism.

The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidua. Fesch-Wyhan syndrome, muscular dystrophy, Wiskott-Aidrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary haemorrhagic telanglectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria,

The invention relates to rice 5-enolpyruvylshikimate phosphate synthase (EPSPS) genomic DNA (AAC87188). The invention also relates to an expression cassette comprising, in the 5'-3' direction, one or more transcriptional enhancer elements selected from AAC87190-C87196), the rice EPSPS promoter, genomic DNA encoding a EPSPS chloroplast transit peptide, genomic DNA encoding a EPSPS chloroplast it is resistant to glyphosate (AAC87189), and a transcriptional terminator. The glyphosate resistant EPSPS contains a region (AAB29793) containing two amino acid substitutions relative to the corresponding wild type region (AAB29792). The invention also encompasses plant genomic EPSPS sequences identified via screening with a rice EPSPS intronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence; vectors and host plant cells comprising a nucleic acid sequence of the invention; transgenic plants (and tissues and seeds thereof) comprising a nucleic acid sequence of the invention, optionally further transformed with a DNA encoding an insect, fungal, viral, bacterial, nematode, stress or herbicide resistance protein; and methods of producing the transgenic plants of the invention. The nucleic acids and constructs of the invention are used to produce a wide variety of morphologically normal, glyphosate resistant plants. The glyphosate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            maize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotide encoding 5-enolpyruvylshikimate phosphate synthase, used to produce transgenic plants e.g. banana, wheat, or rice, having resistance or tolerance to glyphosate herbicide
